

e-Estonia Sample Programme: e-Health

Innovative e-solutions have revolutionised Estonia's healthcare system and proven especially useful during crises. As 99% of prescriptions issued in Estonia are digital, the need to show up at the doctor's office is brought to a minimum. If a face-to-face meeting is still needed, then multiple telemedicine solutions are available. Estonian health records are kept digitally in the national Patient Portal. Citizens can view the information entered by their doctors, their insurance status, medical history, health scans, and lab reports. All this information is backed by the X-Road, which allows secure data exchange between databases in Estonia.

All this has made Estonian digital public administration one of the leading e-health innovators in Europe. We are ready to help any government or organisation build up its digitised health system infrastructure.

Introducing various e-Health Solutions during an online programme:

<p>Hospital Information System</p>	<p>We will share best practices from Estonian cutting-edge Hospital Information System solutions, which have enabled our hospitals to serve 30% more patients without hiring more doctors or increasing resources.</p> <p>The results are achieved by innovative solutions to free up doctors' time from administrative work, allow double bookings to plan visits more efficiently, and exchange data between departments in a quick, secure, and flexible way.</p>
<p>e-Prescription</p>	<p>Find out how Estonia has managed to develop and implement an e-Prescription system that is easy to use for people from all age groups without the need to have elaborate digital skills.</p> <p>Today, 99% of prescriptions in Estonia are taken out digitally, which has saved time and effort for patients, increased the speed of receiving a prescription, and freed up time for doctors to attend to other patients.</p> <p>The e-Prescription system can be built separately from other healthcare systems, making implementation easier and faster, paving the way for digital transformation in e-Health.</p>

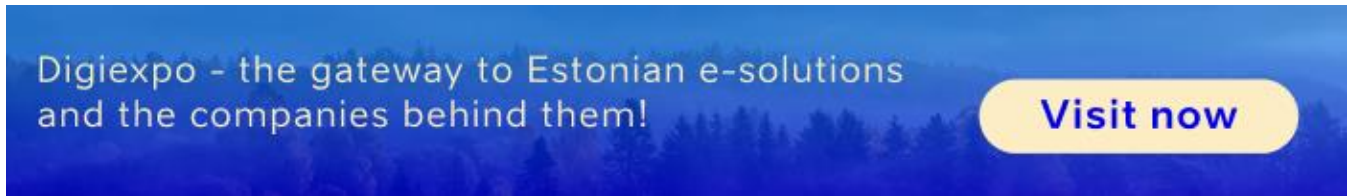

Digital Vaccine Certification	We can introduce you to the WHO backed Vaccine Certification Solution that offers proof of vaccination and enables digitally to monitor vaccine uptake, the integrity of vaccination certifications, supply chain integrity, and resources to provide a fully transparent, secure, and verified vaccine rollout process.
Telemedicine	The most modern telemedicine solutions offer doctors and patients flexible tools and solutions and make sure the treatment data and personal discussion are secure and confidential. Sensitive health data has to be protected during remote consultation and treatment. We can present the best way to do that to benefit from telemedicine without losing the patients' trust.

Have questions or wish to get into more detail regarding our custom programmes?
Our business engagement team is happy to guide you in picking the most suitable event:
